

Eskom Revenue Recovery

Revenue Risk Identification and Revenue Recovery Analytics

SARPA Conference

Date: 24/5 August 2017

Powering your world

Background

Business Processes

Identification of new Risk Sources

Development of Analytical Tools

Developing IT Infrastructure (Advanced Analytics)

- During the past financial year, total energy losses were 8.85%
- Transmission energy losses performed better than target, at 2.22%
- Although distribution losses deteriorated quite significantly to from 6.43% to 7.55%, losses performance is within international norms.
- More than 600 000 meter audits were completed during the year, covering large, small and prepaid customers. This resulted in R215 million being billed to recover revenue due to meter tampers, faulty or vandalised metering installations or customers not correctly loaded on the system.
- Tamper fines of R24 million were also raised.
- Future focus area
 - Reduce non-technical losses by implementing an early warning system, regular and targeted meter audits through automating analysis, and by converting residential customers in Soweto, Midrand and Sandton to split meters

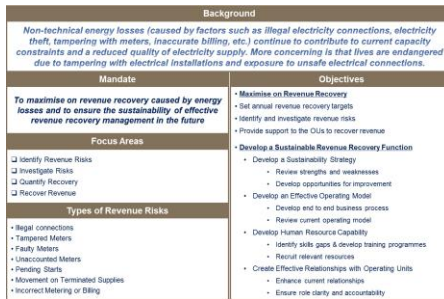

“We can't solve problems by using the same kind of thinking we used when we created them”

Six-steps towards improving Revenue Recovery

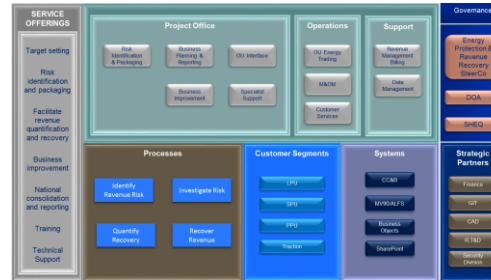

1

Determination of key objectives, drivers and deliverables

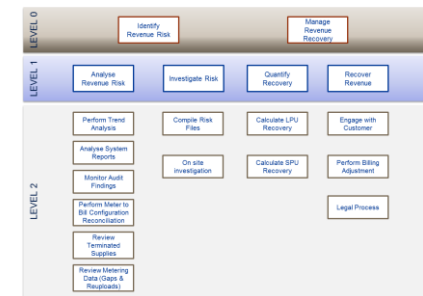

2

Get Organised (Operating Model)

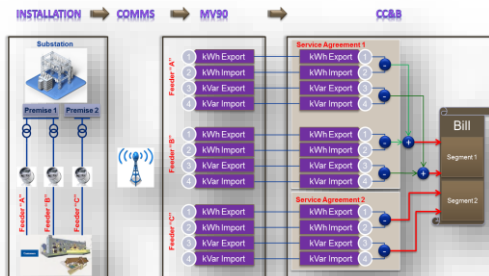

3

Development of Robust Business Processes

4

Identification of new Risk Sources

5

Development of Analytical Tools

6

Developing IT Infrastructure (Advanced Analytics)

Background

Non-technical energy losses (caused by factors such as illegal electricity connections, electricity theft, tampering with meters, inaccurate billing, etc.) continue to contribute to current capacity constraints and a reduced quality of electricity supply. More concerning is that lives are endangered due to tampering with electrical installations and exposure to unsafe electrical connections.

Mandate

To maximise on revenue recovery caused by energy losses and to ensure the sustainability of effective revenue recovery management in the future

Focus Areas

- ☐ Identify Revenue Risks
- ☐ Investigate Risks
- ☐ Quantify Recovery
- ☐ Recover Revenue

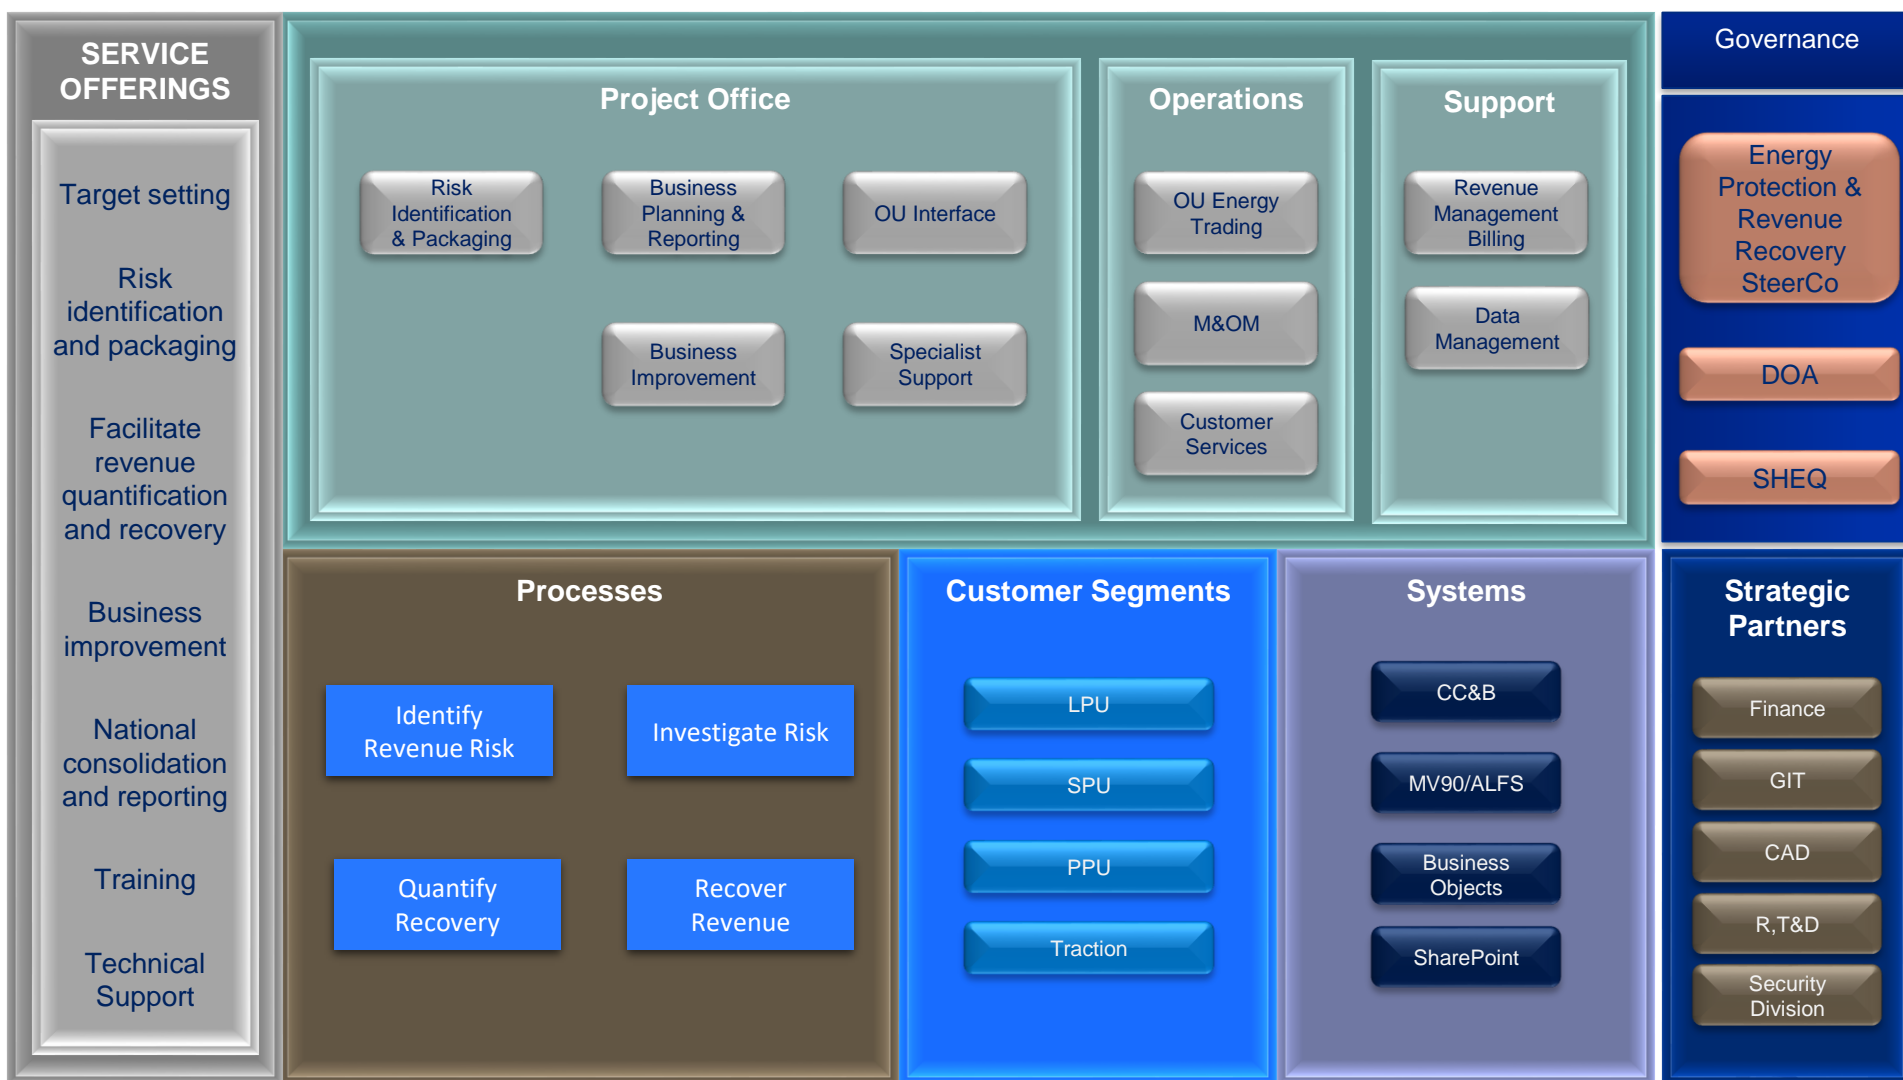

Types of Revenue Risks

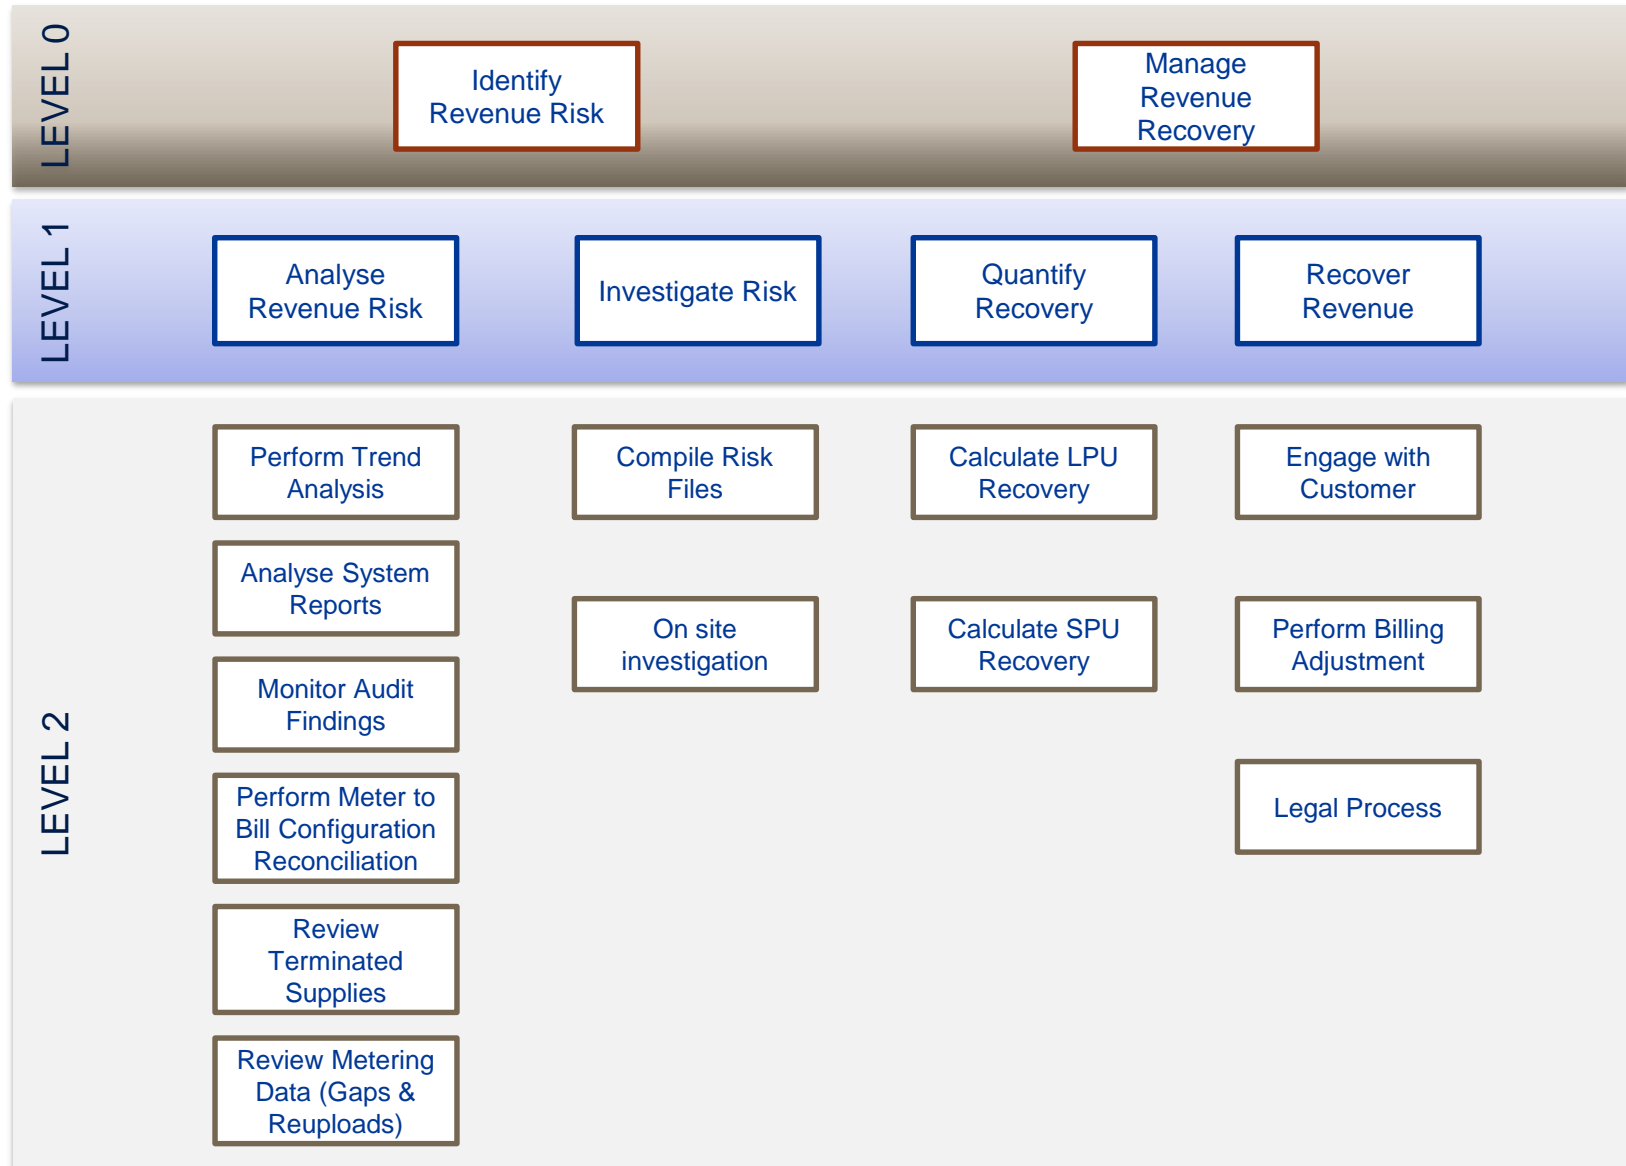

- Illegal connections
- Tampered Meters
- Faulty Meters
- Unaccounted Meters
- Pending Starts
- Movement on Terminated Supplies
- Incorrect Metering or Billing

Objectives

- **Maximise on Revenue Recovery**
 - Set annual revenue recovery targets
 - Identify and investigate revenue risks
 - Provide support to the OUs to recover revenue
- **Develop a Sustainable Revenue Recovery Function**
 - Develop a Sustainability Strategy
 - Review strengths and weaknesses
 - Develop opportunities for improvement
 - Develop an Effective Operating Model
 - Develop end to end business process
 - Review current operating model
 - Develop Human Resource Capability
 - Identify skills gaps & develop training programmes
 - Recruit relevant resources
 - Create Effective Relationships with Operating Units
 - Enhance current relationships
 - Ensure role clarity and accountability

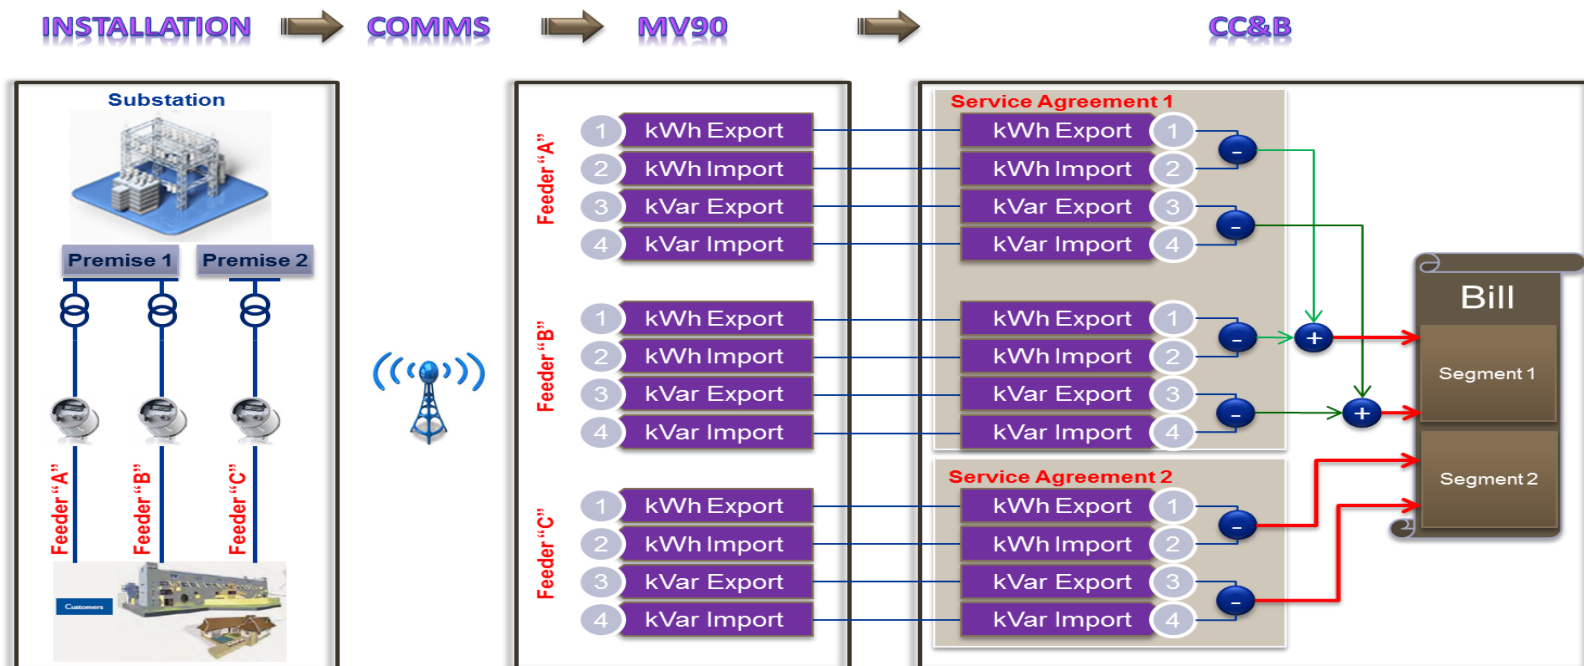

2 Draft Operating Model

New Risk Sources (LPU example)

- Analyse meter-to-bill value chain
- Review all system and process interfaces
- New controls identified
 - Interval Movement on Terminated
 - Recorders not Linked

Current process : (field driven)

- One of the key mechanisms of mitigating energy losses is through conducting energy protection audits at metering installations and fixing of problems found.
- Currently areas are prioritized for audits based predominantly on MV Feeder losses.
- Once areas are prioritized, these audits are typically conducted on an entire area at a time.

New direction: (system driven)

- Simple “Risk Identification” tools were developed to better understand customer’s usage patterns and thereby identifying potential risks much easier.
- This has enabled a platform for a move from blanket meter audits to risk based targeted meter audits.
- Other tools were also developed to assist with the calculation and processing of adjustments

- “A picture paints a thousand words”
- Identifying potential risks by reviewing load profile patterns

- Sudden trend step-down
- No change in NMD

Risk Investigation Tool

Billing Profile

Metering Profile

Billing vs Metering

- The business follows a largely manual process to identify revenue risks and ultimately recover revenue.
- A detailed Business Requirement Specification was developed for a revenue analytics solution that will:
 - Automate the existing Revenue Recovery process
 - Identify and prioritize points of supply with a high revenue risk using data/reports from various sources – Fraud Detection Modules
 - Investigate revenue risks - Generate Work-orders
 - Provide inputs to field audits which may lead to corrections
 - Use the results of field audits and other data inputs to quantify revenue recovery
 - Provide inputs for eventual revenue recovery in CC&B – bill adjustments or rebills
 - Provide relevant reporting
 - Monitor the entire revenue recovery process
- Provide an exploratory environment to identify additional revenue risks
 - Provide the user with the flexibility to analyse various types of data on individual or groups of customers – 'WHAT IF'

Project Development Approach

Waterfall vs Agile

Waterfall – traditional PM approach

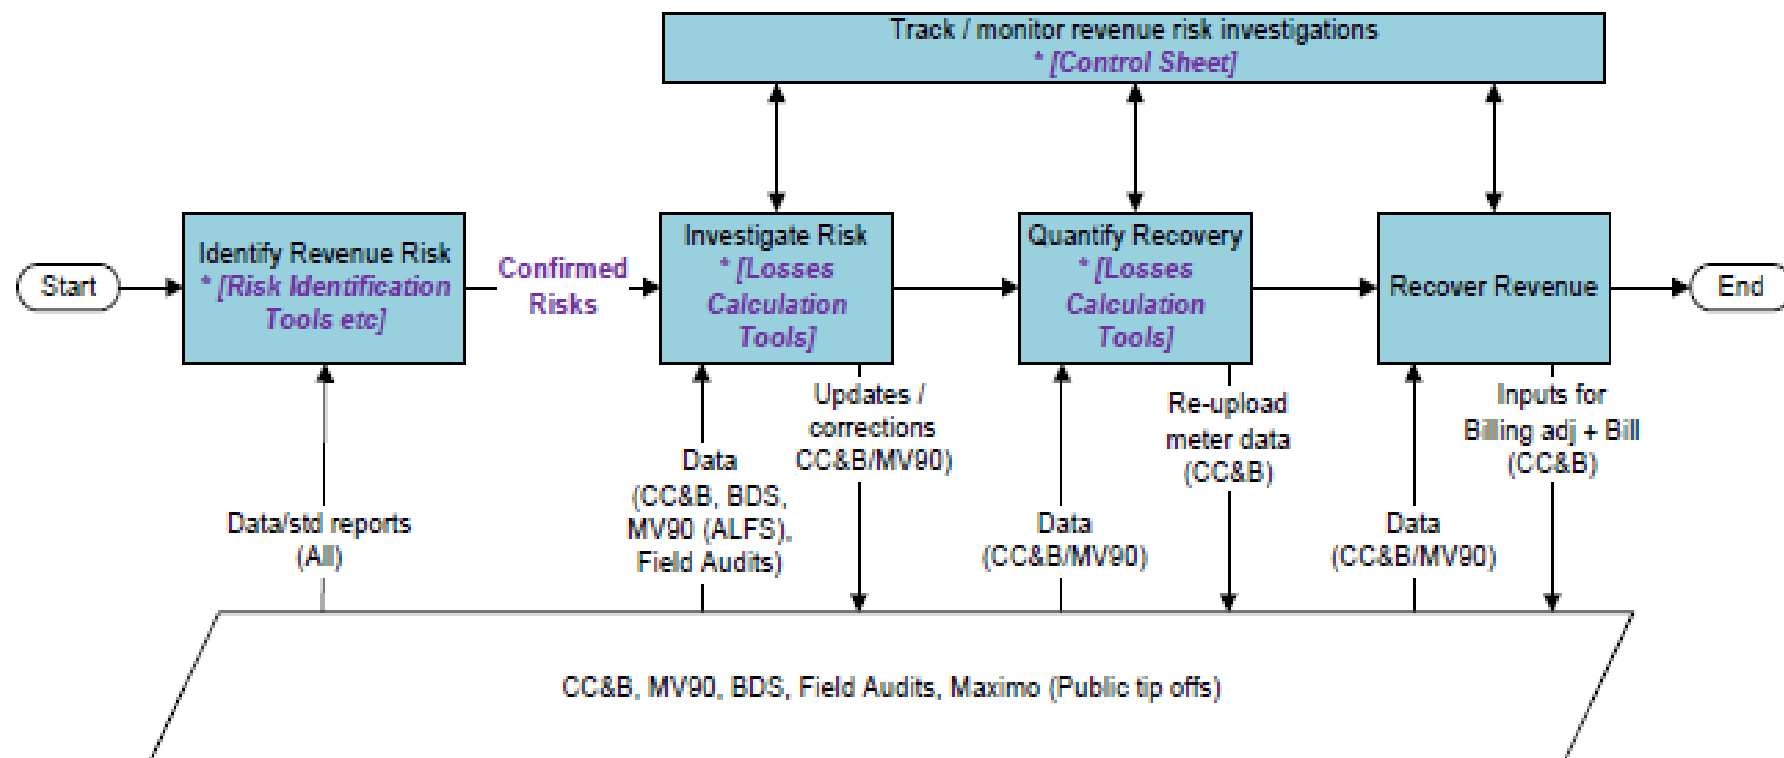

Agile – delivering “bite-size” sections

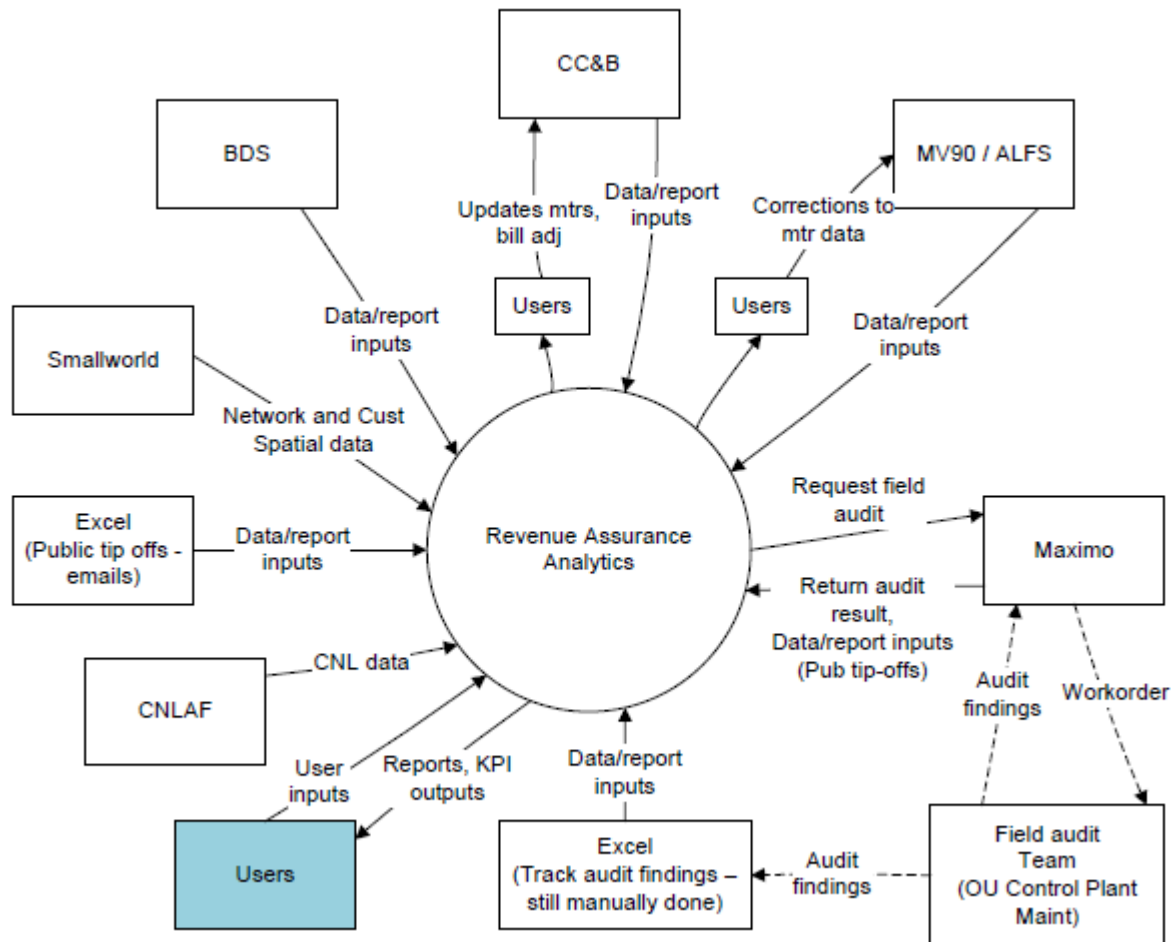

Multiple iterative developments

Data Flow Diagram

A decorative graphic on the left side of the slide. It consists of a large, light blue curved shape that frames a circular inset. Inside the circle, there is a smaller circle containing a handshake, and another circle containing a silhouette of a tree against a sunset sky. The circles are layered and have a hand-drawn, sketchy appearance.

Thank you
